TOPCASINOSG · SUPER-SIMPLE GUIDE

Let AI update your website

Talk to an AI assistant in normal words, and it changes the website for you. No coding needed.

1

Make a key

A secret password for your AI. Takes 1 minute.

2

Give it to your AI

Only once. Ask your developer if it's tricky.

3

Just ask

“Publish the About Us page.” Done.

What's inside

Page 2: four words to know · Page 3: pick a mode · Page 4: make a key · Page 5: give it to your AI · Pages 6–7: sentences you can copy · Page 8: site-wide changes (shared sections, menus, colours) · Page 9: how to undo · Page 10: safety rules · Page 11: problems & questions · Pages 12–14: technical part (only for developers).

BEFORE YOU START

Four words to know

That's all the "tech" you need. Everything else in this guide uses these four words.

Key

A secret password for your AI. It looks like `tcs_A1b2C3…`. Whoever has it can change your website, so keep it secret, like a bank PIN.

Direct

A key that changes the **live website straight away**. The AI can add, change, publish, hide and delete things.

Needs approval

A key that can only **suggest** changes to pages and news. A person must click **Approve** in **AI Changes** first.

Recycle Bin

When a Direct key deletes something, it goes here for **30 days**. Click **Restore** to bring it back.

You are the boss, and you are responsible

A Direct key does exactly what your AI tells it to do, on the real website, with no one checking. What the AI changes is your responsibility. The developers keep the website's code safe; the **content** (texts, pages, casinos, bonuses) is yours to look after.

What the AI can never touch

Users and passwords, API keys, security settings (like 2-step login) and website deployments. Those stay with people.

STEP 0

Pick a mode

Ask yourself one question: **do I want a person to check every change before it goes live?**

YES, CHECK FIRST

✋ Needs approval

- ✓ Suggest changes to pages
- ✓ Suggest new pages and news
- ✓ Suggest changes to Global Sections
- ✓ Upload images
- ✗ Publish or hide anything
- ✗ Delete anything
- ✗ Casinos, bonuses, menus, colours, settings

Every suggestion waits in **AI Changes** until someone clicks **Approve**.

NO, JUST DO IT

⚡ Direct

- ✓ Change pages and news, live
- ✓ Create, publish and hide things
- ✓ Casinos, bonuses, payment methods, RTP, guides, blacklist
- ✓ Global Sections, header & footer menus, website colours
- ✓ Sidebar, snippets, regions, site settings
- ✓ Delete (goes to the Recycle Bin)
- ✗ Users, keys, security, deployments

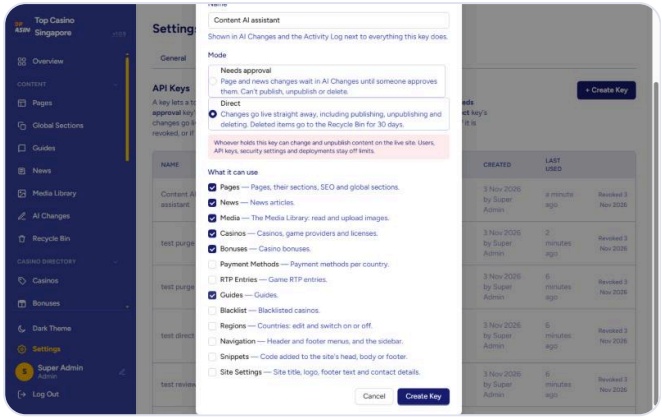

Our advice

New to this? Start with **Needs approval** for a week. When you trust how your AI works, make a second key in **Direct** mode. You can have as many keys as you like, and you choose which areas each key can use (only Casinos, only News…).

STEP 1 · ABOUT 1 MINUTE

Make a key

1. Log in to the admin dashboard.
2. Click **Settings** at the bottom left.
3. Click the **API Keys** tab.
4. Click **+ Create Key**.
5. **Name:** type who will use it, e.g. *Content AI assistant*.
6. **Mode:** click **Needs approval** or **Direct**.
7. **What it can use:** tick the areas the AI may touch. Untick the rest.
8. Click **Create Key**.
9. A box shows your new key. Click **Copy**, then paste it somewhere safe (a password manager).
10. Click **I've copied it**.

The **Create API Key** window, with Direct mode picked.

> **You only see the key ONE time**
>
> After you close the box, nobody can see it again, not even admins. Lost it? No problem: click **Revoke** next to it and make a new one.

> **Only Super Admins and Admins can make keys**
>
> Editors can't. A key stops working if you click **Revoke**, or if the admin who made it is switched off.

STEP 2 · ONLY ONCE

Give the key to your AI

Your AI tool needs 3 things. If this part feels hard, hand this page to your developer: it's a one-time job.

WHAT	WHAT TO PUT
① **The address**	`https://backapi.topcasinosg.com.sg/api/v1`
② **The key**	Your `tcs_…` key. Put it in the tool's **key / credentials / authentication** setting and choose **Bearer** if asked. **Never** type it into a chat message.
③ **The instructions**	Copy the dark box below into the tool's **instructions** (ChatGPT: the custom GPT's Instructions; Claude: the Project instructions).

```
You manage the TopCasinoSG website through its Content API:
https://backapi.topcasinosg.com.sg/api/v1 (send the key as "Authorization: Bearer <key>").

1. First call GET /me and GET /schema. They say what this key may do, list every
   endpoint, and explain how pages are built.
2. Before changing anything, read it first (GET), then change only what was asked.
3. Pages: GET /pages to find the page, GET /pages/{id} to read it, then send the whole
   "sections" list back, edited, to POST /pages/{id}/changes. Keep everything you
   didn't change exactly as it was. Check first with "dryRun": true.
4. News: POST /news for a new article, POST /news/{id}/changes to change one.
5. Other areas (Direct keys only): GET /{area} to list, GET /{area}/{id} to read,
   POST /{area} to create, PUT /{area}/{id} to update, PUT /{area}/{id}/status
   with {"status":"published"} or {"status":"draft"} to show or hide,
   DELETE /{area}/{id} to move to the Recycle Bin.
6. New pages and articles start as drafts. Only publish when the user asks.
7. Before deleting, publishing or changing many things at once, say exactly what you
   will do and wait for the user to say yes.
8. After every change, tell the user what you did, with ids, in plain words.
   To undo a delete: GET /recycle-bin, then POST /recycle-bin/{id}/restore.
9. Global Sections, menus and colours change every page: always confirm first.
Writing rules: match the site's tone and spelling; never invent bonus amounts,
licences or other facts; no scripts or styles in HTML.
```

Which AI tools work?

Any AI tool that can "call web addresses" (also called *actions*, *tools*, *connectors* or *HTTP requests*): ChatGPT custom GPTs with Actions, Claude with a connector or Claude Code, and automation tools like Make, Zapier or n8n.

Test it

Type: *"What can you do with this key?"* The AI should answer with the mode (Direct or Needs approval) and the areas you ticked.

STEP 3 · EVERY DAY

Just ask: sentences you can copy

Copy a sentence, change the underlined part, send it. Red labels mean you need a **Direct** key.

The golden rule: say WHICH, WHAT and WHETHER

Which page or item · **What** to change · **Whether** to publish it. Small, clear requests work best.

👋 Getting started

"What can you do with this key?"

"List all the pages on the website with their status."

📄 Pages

"On the About Us page, change the first paragraph to: …"

"Update the year to 2027 in every heading on the Casino Bonus page."

"Create a new draft page called Live Casino Malaysia with an introduction, 3 FAQs and links to our Malaysia casinos."

"Add a new question to the FAQ on the Responsible Gambling page: …"

"Publish the page About Us."

DIRECT KEY

"Hide (unpublish) the page Sitemap."

DIRECT KEY

"Change the SEO title of the Blackjack page to …"

DIRECT KEY

"Publish all draft pages under Casino Games. Show me the list first."

DIRECT KEY

📰 News

"Write a news article about … and save it as a draft."

"Fix the spelling in the latest news article."

"Publish the news article … now."

DIRECT KEY

"Schedule the article … to go live on 1 December at 9am."

DIRECT KEY

STEP 3 · MORE SENTENCES

Casinos, settings and more

All of these need a **Direct** key with the right area ticked.

🎰 Casinos & bonuses

"Change the welcome bonus text of casino … to 100% up to S$500."

"Add a new free spins bonus for casino … in Singapore. Keep it as a draft."

"Hide casino … from the website for now."

"Add … to the blacklist with the reason: unpaid withdrawals."

"Add GrabPay as a payment method for Malaysia."

"Update the RTP of … to 96.5%."

⚙️ Settings & regions

"Change the contact email in Site Settings to …"

"Switch off the region Vietnam."

🗑️ Delete & undo

"Delete the news article …."

"What is in the Recycle Bin?"

"Restore … from the Recycle Bin."

"What did you change today? List everything."

The AI can't delete these (ask an admin instead)

Images in the Media Library, Global Sections, game providers, licenses and regions. Menu items are on the next page.

STEP 3 · FOR THE PERSON IN CHARGE OF THE SITE

Site-wide changes

These three change **every page at once**, so they're usually for one person: the one in charge of the website.

WHAT	WHAT IT IS	THE KEY NEEDS
🧩 **Global Sections**	Shared blocks (a banner, a "Play responsibly" box) that many pages show.	The **pages** area. **Direct**: changed live. **Needs approval**: suggested in **AI Changes**.
🧭 **Menus**	The **header** menu at the top and the **footer** menu at the bottom.	**Direct**, with the **navigation** area.
🎨 **Colours**	The website's colours (brand blue, gold…), also in **Settings** → **Theme**.	**Direct**, with the **settings** area.

The key's maker must still be an **Admin** or **Super Admin**. If they become an Editor, the key can't make these changes.

🧩 Global Sections

"Which pages use the Responsible gambling global section?"

"Change the text in the Responsible gambling global section to …. Tell me which pages it changes first."

🧭 Menus

"In the footer menu, rename Get Listed Now to List Your Casino."

"Add Payment Guides to the header menu under Casino Reviews, linking to /guides."

🎨 Colours

"What colours does the website use right now?"

"Make the brand blue a bit darker. Show me the old and new colours first."

Good to know

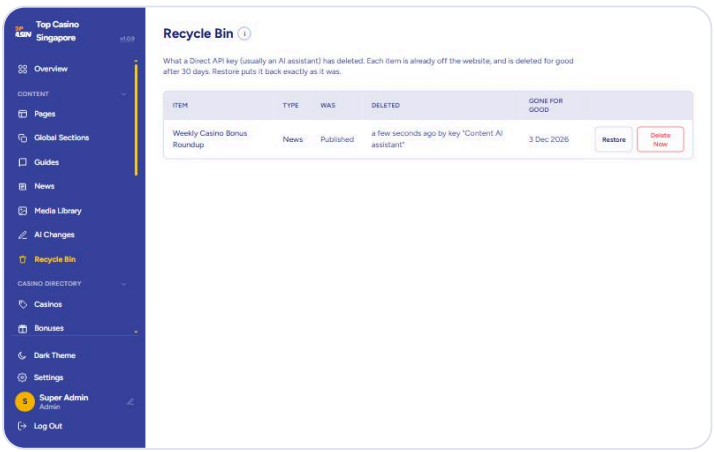

The AI can't create or delete Global Sections (do that in **Pages** → **Global Sections**). A menu item with items under it can't be removed until those are moved first. A removed menu item doesn't go to the Recycle Bin, but the Activity Log keeps what it was. Changes show on the website within about a minute.

OOPS!

How to undo a mistake

Find your problem in the list, do what it says.

WHAT HAPPENED	WHAT TO DO
The AI deleted something	Click **Recycle Bin** in the menu (under Content) → find it → click **Restore**. It comes back exactly as it was, published or not. You have **30 days**.
The AI changed a page badly	Click **Pages** → open the page → **Revisions** tab → pick the version from before → **Restore**. Each page keeps its last 10 versions.
The AI changed a casino, bonus, news or menu badly	Click **Activity Log** in the menu (under Administration). Every change by a key says *"(API key: name)"* and shows the old and new values. Copy the old value back, or ask the AI: *"Change it back to …"*
The AI changed a Global Section badly	**Pages** → **Global Sections** → **Edit** → **Revisions** → pick the version from before → **Restore**. Every page that shows it goes back too.
The AI removed a menu item	Open the **Activity Log** entry to see what it was, then add it back in **Navigation**, or ask the AI: *"Add … back to the menu as it was."*
The AI changed the colours badly	**Settings** → **Theme** → **Reset** next to one colour, or **Reset all to original**. The Activity Log shows the old colours.
The AI published something too early	Ask: *"Hide … again."* Or open it in the dashboard and set it to Draft.
The key was shared by mistake	**Right now:** **Settings** → **API Keys** → **Revoke**. It stops working at once. Then check the Activity Log.

The **Recycle Bin**: what was deleted, by which key, and the date it's gone for good.

STAY SAFE

Do's and don'ts

👍 Do

✓ Give each person or tool its own key, with a clear name

✓ Tick only the areas the AI really needs

✓ Keep keys in a password manager

✓ Ask for one change at a time

✓ Check the website after a big change

✓ Look in the Activity Log once a week

✓ Revoke keys you no longer use

👎 Don't

✗ Paste the key in a chat, email or WhatsApp

✗ Share one key between many people

✗ Ask vague things like “improve the website”

✗ Let the AI invent bonus amounts or licences

✗ Say “delete everything old”: always ask for a list first

✗ Wait more than 30 days if something went missing

Built-in safety nets

Each key can make at most **120 requests a minute**, so a confused AI can't flood the website. Every change is recorded in the **Activity Log** with the key's name. Deletes wait 30 days in the **Recycle Bin**. Pages keep their last 10 versions.

HELP

If the AI says…

THE AI SAYS	IT MEANS → DO THIS
“This API key is not valid, has been revoked…”	The key is wrong or switched off → make a new key (Step 1) and give it to the AI again (Step 2).
“This API key can't use *casinos*”	That area isn't ticked on the key → make a new key with that area ticked.
“This is a Needs approval key”	It can only suggest → approve in **AI Changes**, or make a Direct key.
“Only an Admin's API key can change Global Sections”	The key's maker is an Editor now → an Admin makes a new key.
“Menu item … has items under it”	It has a submenu → move or remove those items first, then try again.
“API keys can't delete this”	That type can't be deleted by AI → delete it yourself in the dashboard.
“Already in the Recycle Bin”	It was deleted before → restore it, or leave it.
“Slug already exists” / “already taken”	Another item uses that web address (maybe one in the Recycle Bin) → pick a different one.
“Too many requests”	The AI was too fast → wait one minute and try again.

Questions

Does the AI see my password? No. It only has its key. Keys can't touch users or passwords.

Can I change a key from Needs approval to Direct? No: make a new Direct key, then revoke the old one.

Who shows up in the Activity Log? The admin who made the key, followed by “(API key: name)”.

Do things deleted by people in the dashboard go to the Recycle Bin? No. Only deletes made with a key.

While in the Recycle Bin, where is the item? Still in its own list (Pages, News…) as a **Draft**, so it's off the website. If someone publishes it, it leaves the bin.

Does a Direct key's work show in AI Changes? Yes, page and news changes appear there as already approved, so you can see what it did.

FOR DEVELOPERS

Technical reference

Base URL `https://backapi.topcasinosg.com.sg/api/v1`. Auth: `Authorization: Bearer tcs_…` (or `X-API-Key`). JSON in and out. Responses: `{"success": true, "data": {…}}` or `{"success": false, "error": {"message": "…"}}`. Limit: 120 requests/minute per key (429 with `Retry-After`). A key acts as the admin who created it and stops working when revoked or when that admin is disabled.

Modes

MODE	BEHAVIOUR
review	Scopes: `pages`, `news`, `media` only. Page/news writes become proposals (`pending`) in AI Changes. Media uploads are direct. All other paths return 403.
direct	Any scope. Page/news proposals are applied immediately (recorded as approved). Every other `/api/v1/<path>` runs the matching admin endpoint `/api/admin/<path>` with identical request/response JSON and validation, if the path is in an allowed area and the key has its scope. `DELETE` moves the item to the Recycle Bin instead of deleting.

Scopes → areas (direct keys)

SCOPE	PATHS UNDER /API/V1
pages	`pages`, `pages/{id}/status|seo|sections`, `pages/reorder`, `global-sections`, `section-templates`, `seo/page/{id}`
news	`news`, `news/{id}/status`, `seo/news/{id}`
media	`media` (GET, POST upload, PUT metadata)
casinos	`casinos`, `game-providers`, `licenses`, `seo/casino/{id}`
bonuses · guides	`bonuses`, `seo/bonus/{id}` · `guides`, `seo/guide/{id}`
payment_methods · rtp · blacklist	`payment-methods` · `rtp` · `blacklist`
regions	`regions`, `regions/{id}/active` ({"active": bool})
navigation	`menu-items?location=header|footer` (DELETE: for good, 409 if items are under it), `sidebar` (GET, PUT whole)
snippets	`snippets`, `snippets/{id}/active`, `pages/{id}/snippets`
settings	`settings/site`, `settings/footer`, `settings/site/logo|favicon`, `settings/theme`
never	users, api-keys, account, auth, settings/2fa, settings/security, system, exports, imports, content-imports, content-changes (review), activity

Pattern per area: `GET /{area}` list · `GET /{area}/{id}` read · `POST /{area}` create · `PUT /{area}/{id}` update (same fields as GET) · `PUT /{area}/{id}/status` `{"status": "draft"|"scheduled"|"published", "publishAt": RFC3339|null}` · `DELETE /{area}/{id}` → Recycle Bin.

FOR DEVELOPERS

Endpoints for every key

ENDPOINT	WHAT IT DOES
`GET /me`	Key name, mode, scopes, the admin it acts for, and a plain-words list of what it can do.
`GET /schema`	Page-building rules, field types, each block type's fields, and the endpoints this key can use.
`GET /pages`, `GET /pages/{id}`	Pages (id, path, status) and one page with its sections.
`POST /pages`, `POST /pages/{id}/changes`	New page / page change: `{title, slug, parentId, metaTitle, metaDescription, sections, note, dryRun}`. Review: proposal. Direct: applied (new pages as drafts).
`GET /news`, `GET /news/{id}`, `POST /news`, `POST /news/{id}/changes`	The same for articles: `{title, slug, excerpt, content, coverMediaId, note, dryRun}`.
`GET /global-sections`, `GET /global-sections/{id}`, `POST /global-sections/{id}/changes`	Scope `pages`. GET returns `{globalSection: {id, name, updatedAt, usedOn}, sections}`. Changes: `{name, sections, note, dryRun}`, like a page; the dry run warns which pages it changes. Admin's key only (403 otherwise). Review: proposal. Direct: applied, saved as a revision. No create or delete.
`GET /settings/theme`, `PUT /settings/theme`	Direct, scope `settings`. GET lists every colour token with its default and current value. PUT `{"colors": {"primary-500": "#3e4ba8", …}}` replaces the whole theme: a token left out goes back to its default.
`GET /media`, `POST /media`	Media Library; upload as multipart field `file`.
`GET /changes`, `GET /changes/{id}`, `POST /changes/{id}/withdraw`	This key's proposals and their review notes.
`GET /recycle-bin`, `POST /recycle-bin/{id}/restore`	Direct keys: what was deleted, and undo.

Page rules in short

- A page is an ordered list of sections, each with a `depth`. Depth 0 (directly on the page) may only be `container` or `global_section`.
- A section at depth N belongs to the nearest container before it at depth N-1, so containers nest (rows, columns, boxes) up to depth 4; a container is at most depth 3. A container's `layout`: stack, row, grid, tabs, accordion or carousel.
- Fields: `{itemIndex, fieldKey, fieldType, textValue, urlValue, mediaId}`; `itemIndex` 0 = the section's own fields, 1+ = repeated items (FAQ questions…).
- To edit: GET the page, change the text you need, send the whole `sections` list back. Use `"dryRun": true` first.

FOR DEVELOPERS

Recycle Bin, examples and errors

Recycle Bin

Binnable: pages, news, casinos, bonuses, payment-methods, rtp, guides, blacklist, snippets. Deleting sets the item to `draft` (snippets: inactive) and records its previous status; restore puts it back. After 30 days the API deletes it for good through the normal admin delete, unless someone published it in the meantime (then it just leaves the bin). The item's slug stays taken while it is in the bin. Other types return 403 on DELETE.

Example: hide a casino, delete an article, undo

```
curl -X PUT https://backapi.topcasinosg.com.sg/api/v1/casinos/12/status \
  -H "Authorization: Bearer tcs_…" -H "Content-Type: application/json" \
  -d '{"status": "draft"}'

curl -X DELETE https://backapi.topcasinosg.com.sg/api/v1/news/40 -H "Authorization: Bearer tcs_…"
→ {"success":true,"data":{"deleted":true,"recycleBinItem":{"id":7,...},"message":"Moved to the Recycle
Bin..."}}

curl -X POST https://backapi.topcasinosg.com.sg/api/v1/recycle-bin/7/restore -H "Authorization: Bearer
tcs_…"
```

Status codes

400 invalid body (the message names the field) · **401** bad or revoked key · **403** wrong mode, missing scope, or not deletable · **404** no such item, or a path keys can't use · **409** conflict (slug taken, already in bin, outdated proposal) · **429** rate limit.
